Mayank Kantharia

Melbourne | +61 0411683252 | mayankkantharia01@gmail.com | GitHub | LinkedIn | Portfolio

Profile

Data Scientist with experience in machine learning, NLP, cloud-based systems, and end-to-end analytical solution development. Skilled at transforming complex datasets into actionable insights, building scalable ML services, and collaborating with stakeholders to deliver business-focused outcomes. Passionate about applying advanced analytics to solve real-world problems and support data-driven decision-making.

Key Skills

Machine Learning & Analytics: Supervised/unsupervised ML, NLP, LDA, sentiment analysis, embeddings, ranking models, model evaluation, statistical analysis

Programming & Frameworks: Python, R, Flask, Django, FastAPI, SQL

Cloud, APIs & Platforms: AWS (EC2, S3, DynamoDB, Lambda, API Gateway), REST APIs, OpenAI API, Supabase, pgvector

Databases & Tools: MySQL, MongoDB, PostgreSQL, Git, GitHub

Visualization & BI: Tableau, Power BI, Matplotlib, Seaborn

Professional Strengths: Detail-oriented, Analytical thinker, Clear communicator, Adaptable collaborator, Well-organized

Education

RMIT University, Melbourne (3.4/4 GPA) **2024-2025**

Master of Data Science

Mumbai University, Mumbai **2019-2023**

Bachelor of Computer Engineering (8.96/10 GPA)

Internships

TryPath | Data Scientist Intern | Internship **July 2025 – Nov 2025**

- Designed and deployed a RAG-based AI career guidance system using OpenAI GPT, embeddings, and Supabase pgvector to deliver personalised recommendations.
- Built Python-based ML services using FastAPI, integrating ranking models, retrieval pipelines, and optimisation logic to improve recommendation accuracy.
- Developed market-aware role insights incorporating salary, experience range, and skill demand to enhance decision relevance for users.
- Created timeline-driven learning roadmaps with automated scheduling via Google/Outlook Calendar APIs.
- Applied prompt engineering and experimented with Agentic RAG to improve orchestration and contextual reasoning.
- Collaborated in a 5-member Agile team using GitHub, Notion, and Slack, contributing to sprint planning and documentation.

Projects

Cloud-Based Music Subscription Web Application | RMIT

AWS EC2, S3, DynamoDB, API Gateway, Lambda, Ubuntu, Apache2

- Developed a fully deployed cloud application hosted on an EC2 Ubuntu server using Apache2, accessible via public DNS.
- Designed and implemented DynamoDB schemas for login, music, and subscription data with optimized key structures.
- Built backend logic for login, registration, subscription management, and music queries using DynamoDB read/write operations.
- Automated image retrieval and upload by downloading artist images and storing them securely in S3.
- Integrated API Gateway and Lambda to process user registration, subscription updates, and data retrieval through REST APIs.

- Delivered a complete end-to-end cloud solution demonstrating scalable architecture and AWS best practices.

Russia-Ukraine War | Social Media & Network Analysis (Reddit + YouTube) | RMIT

Python, PRAW, YouTube API, NLP, LDA, VADER, NetworkX, Louvain

- Collected and processed 90,000+ Reddit and YouTube comments using platform APIs, performing large-scale cleaning and preprocessing.
- Built an NLP pipeline (tokenization, stemming, stopword removal, frequency filtering) for sentiment and topic analysis.
- Applied VADER sentiment analysis and LDA topic modeling with coherence/perplexity tuning to compare cross-platform discourse.
- Constructed Reddit user-interaction graphs, applied Louvain community detection, and simulated information diffusion using the Independent Cascade model.
- Generated insights on sentiment polarization, topic diversity, community structure, and narrative spread across platforms.

NLP Clothing Review Classification & Web Application | RMIT

TensorFlow, FastText, TF-IDF, Logistic Regression, Flask

- Built end-to-end NLP pipelines for classifying product recommendations using text reviews.
- Implemented preprocessing: regex tokenization, stopword removal, rare-word filtering, vocabulary creation.
- Generated Bag-of-Words, TF-IDF, and embedding-based document vectors for model training.
- Compared multiple ML models using 5-fold cross-validation and evaluation metrics.
- Developed a Flask-based shopping website integrating the trained ML model for real-time recommendation prediction.
- Implemented keyword-based search, item browsing, and user review submission with dynamic ML inference.

Research Based Project on Deep Learning | Final Year Project | IIT Bombay

PyTorch, TensorFlow, Deep Learning, Attention Mechanisms

- Built a Few-Shot Learning model for hyperspectral image classification using high-dimensional spectral–spatial data, integrating Temperature Scaling and Attention mechanisms to improve predictive reliability.
- Performed preprocessing and feature extraction on curated HSI datasets to address spectral–spatial variability and enhance model generalization.
- Evaluated performance across multiple HSI benchmarks using cross-validation and ablation studies to quantify the impact of architectural components and tuning strategies.
